

## **ABSTRACT**

The present study was conducted to compare the efficacy of Transvaginal Cervical length and Modified Bishop's score in the prediction of normal vaginal delivery following PGE 2 gel induction. 100 primigravida patients with term gestation were included in this study conducted at Govt RSRM Lying In Hospital. The results were tabulated and analysed. It was found that TVS cervical length in the range of 1-3 cm was a better predictor of normal vaginal delivery than Modified Bishop's score.

**KEYWORDS:** Induction, Labour, Bishop's score, Cervical length
